Advanced Services

Termite Treatment

The standards for termite treatment vary depending on the type of new construction.

For example, monolithic or raised block slab, crawlspaces, beach houses, or any combination of these types of construction types require treatment application to the areas where the structure meets the soil.

Bed Bug Treatment

- Having bed bugs does not mean you are dirty
- Bed Bugs are most active at night
- Bed Bugs are hitchhikers & easily transported
- Bed Bug bites are painless, but some people have an allergic reaction to the saliva injected by the bed bug as it feeds

Heat Treatments are an effective way to eliminate bed bugs quickly, but tend to be more effective than conventional treatment methods. Portable heaters and fans are used to gradually heat the air to about 120 - 130°F while monitoring with sensors and strategically placing fans for air circulation.

Specialized Services

Crawlspace Encapsulations

Preventative Moisture Control

Stop humidity-related problems before they develop with moisture control. We use state-of-the-art equipment, we successfully eliminate excess humidity/moisture from your crawlspace.

KEEPING YOUR CRAWLSPACE DRY

Our goal is to reduce and maintain the relative humidity in your crawl space to below 60%. For the wood in your crawlspace, we try to lower the moisture content to below 15%. Lower humidity prevents mold growth, fungus, and wood decay.

Other Services Include:

- French Drains and Sump Pumps
- Bora-Care
- Treatment of Fungal Growth in Crawlspace
- Vapor Barriers
